Reckon

Reckon where it's cheaper. Grocery prices branch by branch, one city at a time, starting with Ra'anana.

7
Ra'anana branches read every day

13,052
products with live shelf prices

12%
gap between Shufersal Deal and Express on the 1,441 products all six grocery branches sell

41%
gap on one bag of Bamba (₪4.90 vs ₪6.90) inside the same chain, same city

Our own figures, computed from the price files of 12 November 2026.

The market

Since 2015 Israeli food chains must publish every price in every branch, every day. A handful of services turn those files into comparisons, and the savings are real: a 2026 survey of 178 products found a ₪443 (17.7%) gap between the cheapest and dearest chain, and a Rosh Hashana basket of 150 products differed by ₪577.[1,2] Yet the same reporting finds that most Israelis keep shopping at the same chain, and that use of the comparison apps is far below their potential.[1,3] The data exists. The habit does not.

WHO	WHAT IT DOES	WHERE IT STOPS
CHP	The most used comparison site. Full basket across nearby branches, chains and pharmacies.[4,5]	Run by one person; a search-and-table tool. No neighbourhood shops.[3,5]
Pricez	Since 2011: barcode scan, shared lists, price-history graphs, alerts.[6]	Its business is mainly selling product and shopper-behaviour data to retailers.[3]
Zap Market	Scan a barcode, get a comparison.[7]	Store reviews complain of bugs.[7]
Kaspenu	AI app launched April 2025; average and lowest price nationally.[8]	Shows the lowest price without naming the store.[8]
Chatbot plug-ins	Ask an AI assistant for grocery prices.[4]	Needs a subscription and a signal; nothing in your hand at the shelf.

The gaps, and what Reckon does about each

GAP IN WHAT EXISTS	RECKON
National and chain-level. The real question is "which of the shops I can walk to?"	One city, branch by branch. It shows that the Deal on HaHaroshet and the Express on Bar Ilan are the same company with a 12% price difference.
Comparison happens before shopping, when nobody has time. Nothing checks what you actually paid.	**Receipt audit.** Photograph the receipt; it reads the barcodes and shows what that exact basket costs at every branch today, and what you would have saved.
Hebrew only, in a city with one of Israel's largest English-speaking communities.	English or Hebrew interface. Type "milk", "diapers" or "olive oil" and get חלב, חיתולים, שמן זית.
Households plan shopping on WhatsApp, but lists live inside each app.	**One tap to WhatsApp:** the list, the cheapest branch, the total, and a link that reopens the same list for whoever is doing the shop.
App-store install, an account, and a data connection in a concrete supermarket.	A web app that installs from the browser, needs no account, and keeps the full price list on the phone, so it works with no signal.
Results are tables of numbers.	Charts: a city price index, the biggest gaps on single products, where the offers are, when prices last moved, and price history that builds daily.
Free apps paid for with your shopping data.	No sign-up, no analytics, no server. The list and the receipt photo never leave the phone.

What is in the box

- **Search** in English or Hebrew, by name, brand or barcode, across every branch at once.
- **Barcode scan** with the phone camera (or from a photo). Pick up a product in one shop and see its price in the other six.
- **Smart list.** Prices the whole list at every branch, applies "2 for ₪X" and "1+1" offers, optional club prices, and suggests a two-stop plan when splitting the shop saves more.
- **Shopping mode** to tick items off in the aisle.
- **Receipt audit**, read on the device in a few seconds.
- **WhatsApp, share sheet and copy** export, with a link that carries the list.
- **Insights** page with five charts, each with a table view, in light and dark mode.
- **Installable and offline.** Home-screen icon, shortcuts to Scan, List and Receipt.
- **Product photos and English names** from Open Food Facts where it has them.

How it works

A scheduled job reads each chain's official store list, keeps the branches whose city is Ra'anana, downloads that day's full price and promotion files, and publishes four small data files. The app is static: no database, no login, no running cost. Every time a price differs from the previous run the change is appended to a history file, so the price-history charts fill in on their own. New chains are one entry in a list of sources.

Side by side

CAPABILITY	RECKON	NATIONAL COMPARISON APPS, AS THEIR LISTINGS AND PRESS DESCRIBE THEM
Branch-level prices in Ra'anana	**Yes, 7 branches**	Yes, and across all chains
Chains covered	1 today (Shufersal, 4 formats)	**All major chains**
Barcode scan	**Yes**	Yes (Pricez, Zap Market)
Receipt audit against today's prices	**Yes, on the device**	Not described in any source we found
English interface and English search	**Yes**	Not described in any source we found
WhatsApp export with a reopenable list	**Yes**	List sharing inside the app (Pricez)
Works with no signal	**Yes**	Not described
Account or install required	**Neither**	App install; data sold to retailers (Pricez)
Price history and alerts	History from launch day; no alerts yet	**Years of history, alerts (Pricez)**

Honest limits today

- **One chain.** Shufersal publishes openly. Rami Levy, Yochananof and others publish through a shared portal that requires signing in with each chain's public account, and Carrefour and Victory did not answer from our build servers. Until they are added, CHP is the better tool for chain-versus-chain questions.
- Receipt audit relies on barcodes printed on the receipt and has been tested on clean images, not yet on crumpled thermal paper.
- Offers are simplified to sale price, "N for ₪X" and "1+1". Coupons and basket-level deals are left out.

Next

- Add Rami Levy, Yochananof, Victory, Carrefour, Stop Market, Super-Pharm branches in Ra'anana.
- Price-drop alerts for the items on your list.
- Hebrew reading of receipts with no printed barcodes.
- Per-unit prices (per 100 g, per litre) for honest size comparisons.
- The same build for Kfar Saba, Herzliya and Hod HaSharon: it is one city code.
